

OPERATIONS STRATEGY & EXECUTIVE REPORTING

A consulting-style case study for scalable growth, sharper decisions and disciplined execution

AURELIS MARKET SERVICES | 2026-2028

Prepared by Tarunima Vijay · Illustrative case, synthetic data

EXECUTIVE BRIEF

Growth is available, but operating friction is suppressing conversion

Aurelis can unlock margin and service improvements by simplifying workflows, clarifying ownership and institutionalizing performance routines.

12–15% addressable revenue uplift

6–8 pts potential margin expansion

30% faster decision cycle

1 Focus the portfolio

Prioritize two advantaged customer segments and exit low-value bespoke work that absorbs capacity without improving retention.

PRIMARY LEVER
Revenue quality and mix

2 Industrialize delivery

Standardize intake, planning, handoffs and exception management across commercial and operations teams.

PRIMARY LEVER
Margin and on-time delivery

3 Run the business

Shift from backward-looking reporting to a weekly decision cadence with clear owners, thresholds and corrective actions.

PRIMARY LEVER
Decision speed

Leadership ask

Approve the 90-day mobilization, assign one accountable executive sponsor and protect cross-functional capacity for the first two waves.

MARKET SIZING

A \$1.8B market narrows to a credible \$240M three-year opportunity

The opportunity is concentrated in digitally mature mid-market clients with recurring reporting and workflow needs.

Sizing logic

Installed base	48,000 target accounts
Annual spend	\$37K average category spend
Scope filter	40% geography × segment fit
Capture rate	33% reachable over 3 years

PORTFOLIO LENS

Use a transparent top-down bridge, then triangulate with account-level capacity and win-rate assumptions before investment approval.

OPERATING DIAGNOSTIC

Five friction points explain most of the performance gap

The largest issue is not effort. It is variability: inconsistent intake, unclear decisions and weak exception management create avoidable rework.

Demand intake	Multiple channels; incomplete briefs	High
Prioritization	Local decisions; no enterprise trade-off	High
Delivery flow	Handoffs and rework across teams	High
Reporting	Manual consolidation; lagging indicators	Medium
Governance	Meetings without decision rights	Medium

CONSULTING IMPLICATION Design the operating system around decisions and exceptions, not around producing more reports.

EXECUTIVE PERFORMANCE VIEW

A single page should connect outcomes, drivers and required action

The dashboard separates lagging results from leading operational indicators and highlights only material exceptions.

ROOT-CAUSE ANALYSIS

Nearly half of elapsed time is queue and rework, not productive work

A value-stream view shows only 53% of elapsed time adds customer value; the rest is waiting, rework and handoffs.

End to end: 12.0d elapsed · 6.4d value-add · 53% flow efficiency

WHERE THE NON-VALUE-ADDING TIME GOES (SHARE OF DELAY)

DESIGN PRINCIPLE

Move quality upstream: minimum intake standards, pre-approved service patterns and risk-based review paths reduce delay without weakening control.

TARGET OPERATING MODEL

A four-layer operating system turns strategy into repeatable execution

Each layer has a distinct purpose, owner and management rhythm.

STRATEGY & PORTFOLIO	Where to play, investment guardrails, quarterly choices	Owner: Executive team	Monthly
PLANNING & CONTROL	Demand shaping, capacity allocation, weekly trade-offs	Owner: Operations lead	Weekly
DELIVERY SYSTEM	Standard work, workflow automation, quality at source	Owner: Delivery teams	Daily
INSIGHT & GOVERNANCE	KPI definitions, exception alerts, decision records	Owner: PMO / analytics	Weekly

MONTHLY Portfolio council

WEEKLY Performance huddle

DAILY Flow management

TRANSFORMATION PORTFOLIO

Sequence nine initiatives by value, feasibility and dependency

Three no-regret moves establish control while two structural bets create the largest long-term value.

IMPLEMENTATION ROADMAP

A 90-day mobilization creates visibility, control and early proof

The roadmap balances immediate operating discipline with the design work required for sustainable change.

0-30 DAYS	31-60 DAYS	61-90 DAYS
Stabilize ● Confirm sponsor and decision rights ● Baseline KPIs and process performance ● Launch intake and exception standards	Standardize ● Pilot weekly control tower ● Deploy service catalogue and RACI ● Automate priority reporting	Scale ● Expand pilot to priority teams ● Lock benefits and control owners ● Approve wave-two investment

Day-90 proof point: one integrated performance view, a functioning decision cadence and measured benefits from at least two operational pilots.

LEADERSHIP DECISION

Three commitments convert the strategy into operating momentum

The transformation should begin with visible sponsorship, protected capacity and a small number of non-negotiable management routines.

Sponsor the change

Name one accountable executive, resolve cross-functional trade-offs and reinforce the target behaviors in every governance forum.

OWNER
Executive sponsor

Protect the capacity

Create a focused transformation team with clear workstream ownership and explicit backfill for critical operational roles.

OWNER
Transformation lead

Measure the outcomes

Track value, service and adoption from week one; stop or redesign activity that does not move the agreed outcomes.

OWNER
PMO and finance

RECOMMENDED NEXT STEP

Authorize the 90-day mobilization and hold the first executive performance review against the new KPI set.
